Assignment 1 - EXAMPLE

Category: Manufacturing

Title: Instruct an artist to create a 3D model print it on a 3D printer

When craving a custom 3D model, as a first step you have to instruct an artist to create a project for you. First you have to send him several sketches, and then tell him what to change until you are satisfied with the result. After that, you choose a plastic color you want to use for 3D printing. If you have the color at home (in stock), you check how much color you have left. If it's under 100 grams, you put it on your shopping list. If you do not have the color at home, you order it. When you have the plastic, you can turn the printer on and heat up the bed and the extruder (it continuously sends you back its status). While doing that, you can generate the gcode file for your printer out of the STL sent to you by the artist. After that you print the model.

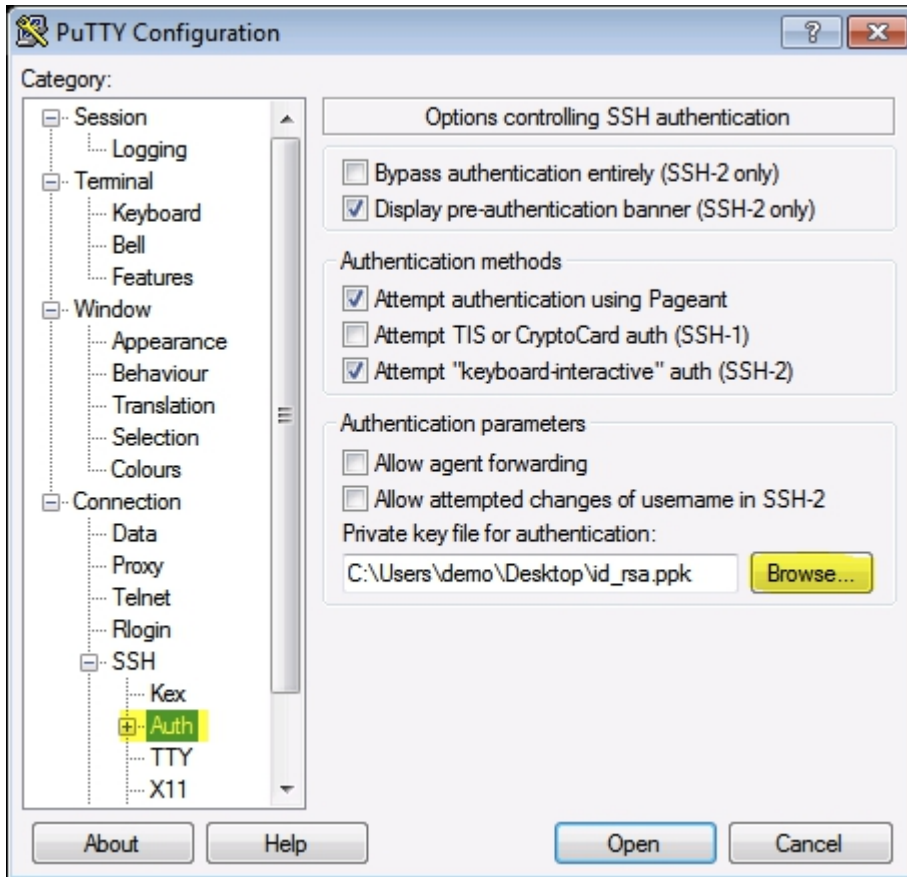

Assignment 1 - Instructions

You get an email with your assigned text - each resulting process model has to roughly have the following specs:

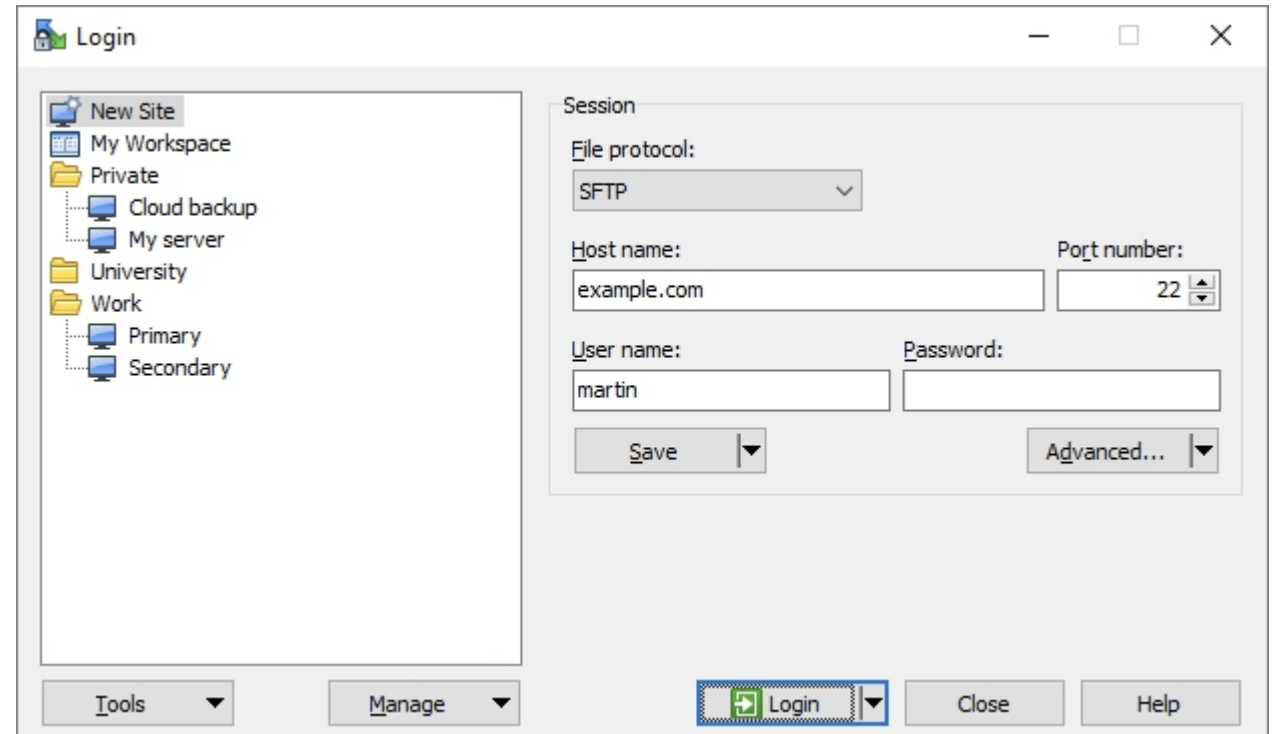

- BPMN-2 format - Signavio
- Min 10 Process steps.
- Min 2 decisions (2 or more alternative branches and loops do not count)
- Min 1 parallel
- Min 1 loop.
- at least 4 steps should be human steps
- at least 3 steps should be automatic steps (calculation by a computer, data retrieval, ...)
- differentiate between human and automatic steps by using appropriate icons

Use the magic powers of common sense and interpretation when reading and modeling the texts assigned to you.

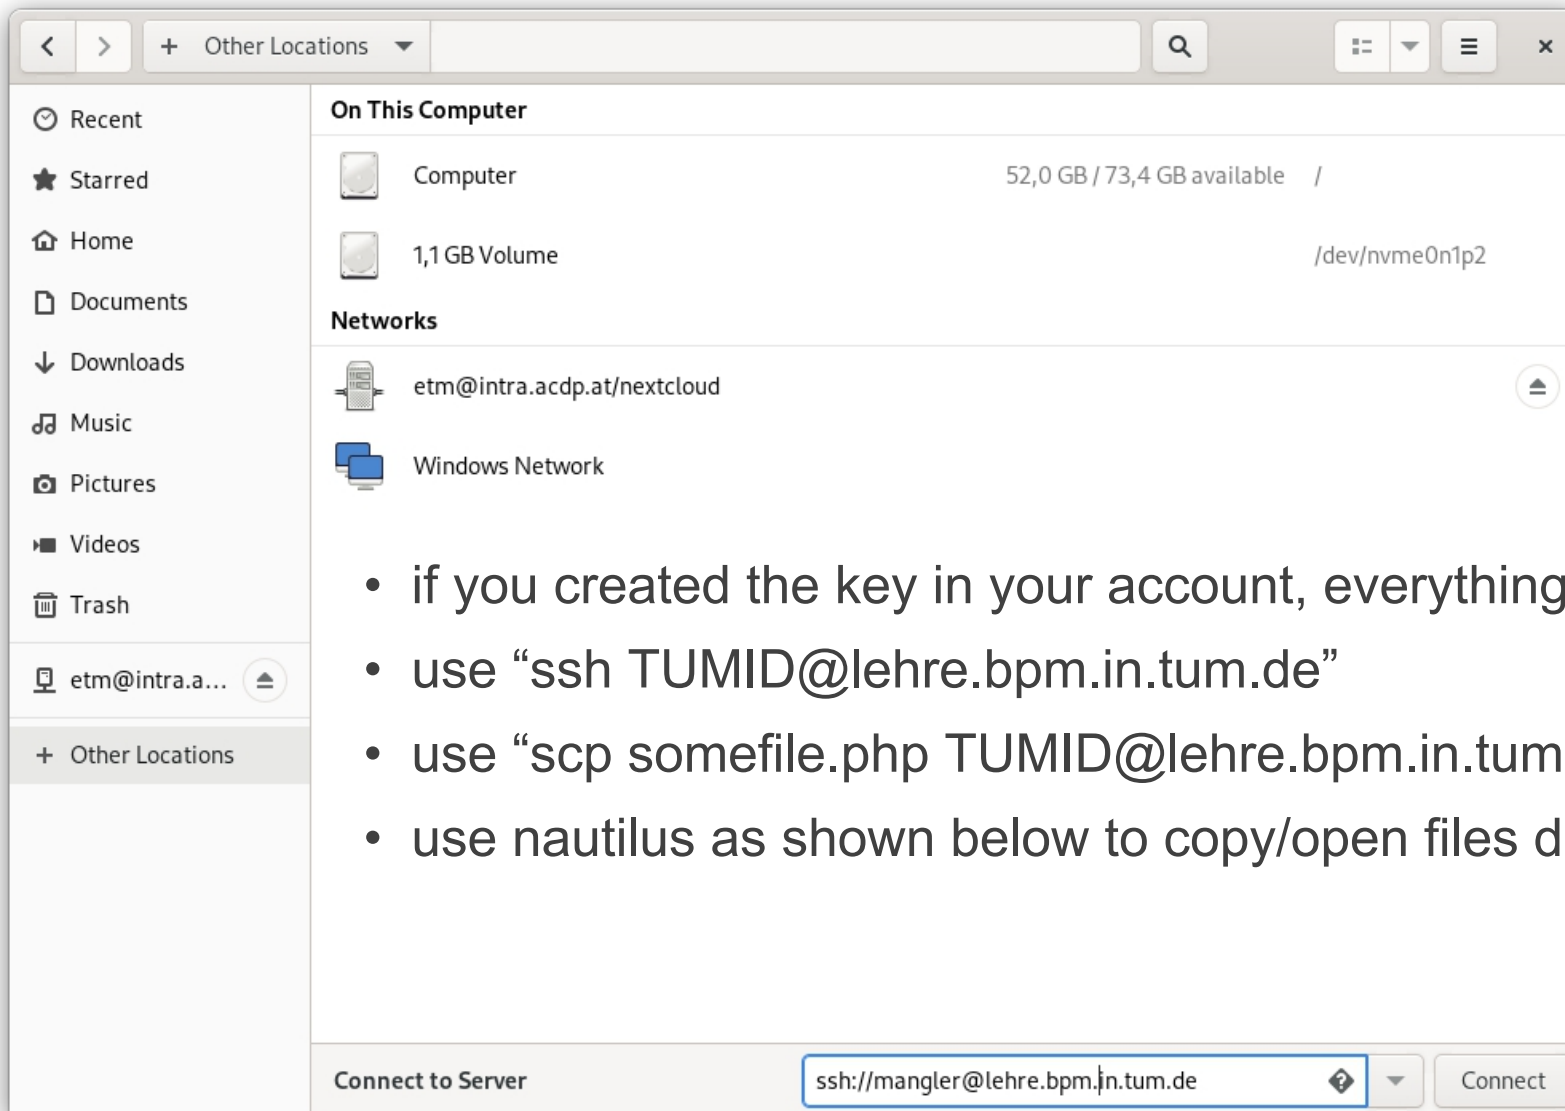

Login Windows

- server: TUMID@lehre.bpm.in.tum.de
- add your PRIVATE key as shown to the left
- for winscp use
 - Host name: lehre.bpm.in.tum.de
 - User name: TUMID (e.g. xx42toy)
 - Password: empty
 - Advanced: add your PRIVATE key

Login Linux

First Login

- Go to the directory public_html in your home directory

```
# cd public_html
```

- Put a php file there

```
<?php  
    echo "hello TUM";  
?>
```

- go to

```
https://lehre.bpm.in.tum.de/~TUMID
```

What to use?

- Python (pip install --user ...)
 - Ruby (gem install --user)
 - NodeJs (npm install)
 - PHP: put stuff in public_html
 - C Toolchain (libjson, libcurl)
-
- If for Py/Ru/NJs you need a port, use one in the range of 10000 to 20000. Make sure the port is not taken (look for LISTEN):

netstat -atn
