Declaration of Academic Integrity

I confirm that this bachelor's thesis is my own work and I have documented all sources and material used.

I am aware that the thesis in digital form can be examined for the use of unauthorized aid and in order to determine whether the thesis as a whole or parts incorporated in it may be deemed as plagiarism. For the comparison of my work with existing sources I agree that it shall be entered in a database where it shall also remain after examination, to enable comparison with future theses submitted. Further rights of reproduction and usage, however, are not granted here.

This thesis was not previously presented to another examination board and has not been published.

Garching, 15.04.2026

Xin Wen

Introduction

For exposes, create this chapter, plus start with chapter 2 (Related Work).

Motivation

Why are we doing it? About 1 page.

Research Questions

At least 3 questions. They should not be answerable yes/no. Questions should be questions (1 sentence). But you are allowed to explain them in more detail. In the explanation also tell how you plan to prove that your potential future solution is good.

About 1 page.

RQ3: What are the perceived benefits and limitations of the proposed system for supporting document-based process modelling?

Contribution

What will/have I do/done that nobody else has done before. About 1/2 page.

Methodology

Design Science in Information System (Hevner). How are we doing research?

(1) Summary what design science is (it uses stakeholders, artefacts, steps, ...). (2) What are the stakeholders, artefacts, steps for MY case.

About 1.5 pages.

Evaluation

How will I evaluate that my proposal is good. This ties into the research questions.

About 1 page.

Structure

Which chapters will my thesis have, and what are they all about.

About 1/4 page.

Implementation

Evaluation

Evaluation Method

A qualitative evaluation was conducted with four expert users with both academic and practical experience in process modelling. The evaluation consisted of task-based activities followed by a questionnaire including open-ended questions to assess the system's usability and perceived usefulness, as well as to capture participants' expert perspectives on potential improvements and additional features.

Each evaluation session followed this procedure. It began with a brief guided walkthrough and demonstration of the system, introducing its workflow and main features. Participants were then asked to complete two tasks: an initial exploratory task designed to enable them to gain hands-on experience with the system, followed by a more realistic process modelling task based on a real-

world document. If time permitted, participants could additionally use the system with their own documents.

Following task completion, participants completed a questionnaire including a series of open-ended questions regarding their experiences with the system, covering aspects they found useful or problematic, as well as suggestions for improvements and desired features. In addition, participants were asked whether they would consider using the system in future document-based process modelling tasks and to elaborate on their reasoning. Each evaluation session lasted approximately 40–50 minutes.
